Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA, Statistical Reporting Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

For information call: (305) 420-6015.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1983-84 CROP YEAR

Central Florida citrus growing areas experienced some of the worst temperature extremes on record. Highs in the 80's and lows in the 20's and teen's, occurring within the same week in December, led to the most destructive freeze of this century. The hard freeze of December 25-26 was preceded by unseasonably warm temperatures which continued to stimulate tree growth and did not promote semi-dormancy.

By the beginning of harvest in September cumulative rainfall amounts were above normal for most reporting stations in the central and south Florida growing areas. With the absence of severe freezing temperatures in the previous winter, trees had made excellent recovery from the 1980-81 and 1981-82 freezes.

The first low pressure system, preceded by varying amounts of rainfall, moved through the State during the last week of September. Temperatures were 2 to 4 degrees below normal but daytime highs reached the mid-to-upper 80's most days.

October weather was marked by above average temperatures in the absence of cool fronts. Daytime highs in the 80's and 90's in some areas and showers on a regular basis kept trees in an active growing condition with many groves showing good flushes of new growth.

Frequent scattered rainfall continued into November with a cool front moving through the State the second week. Lowest temperatures were in the high 30's and low 40's on several mornings. By the first week of December, temperature averages again climbed to above normal levels with daily highs in the mid-to-upper 80's.

Temperature averages remained at or above normal levels until a fast moving high pressure system entered the State from the northwest in the late evening of December 24. By early morning, temperatures had plunged to the low 20's and upper teens in most interior and upper West Coast growing areas. The cold,northwest wind continued to hold temperatures down all Christmas Day, and daytime highs reached only the mid 30's, breaking many long time records. Many stations in the northern citrus growing area reported 32 degrees or below by 6 P.M. on Christmas Day.

By the morning of December 26, low temperature readings in the teens and low 20's were again reported. Lowest readings generally did not set new levels, but record durations below 32 degrees were reported in many areas.

January temperature averages were generally below normal, but daytime highs frequently reached the 70's and 80's with light amounts of rainfall reported regularly.

Temperatures in early February were below average levels but higher by mid-month. Another cool front the last of February and first of March saw temperatures in the mid-and-low 30's on several mornings, but little or no additional damage to citrus was reported.

Rainfall in the spring was very scattered. Most stations reported below normal cumulative amounts by April 1 with some in the southern interior and lower East Coast areas reporting above normal amounts.

April was unseasonably cool, with average temperatures 4 to 6 degrees below normal in most areas. But by late April and early May, daytime highs reached into the 80's and low 90's. Except for several weeks of hot, dry conditions in late May, rainfall amounts during the summer continued at near normal levels in most areas.

1983-84 PRODUCTION AND TREE CENSUS

Florida's season began with a normal bloom period extending from mid-March to mid-April. Spring temperatures were slightly below normal ranges and cumulative rainfall amounts were above in most citrus growing areas. Trees had made an excellent recovery from the January 1981 and 1982 freezes.

By late summer a good crop had been set. The initial October forecast was for 168 million boxes of oranges, up sharply from the previous two seasons. Grapefruit were forecast at 46 million boxes, 14 percent more than the 1982-83 season. Weather was warm with only one cool snap prior to the December 25-26 freeze. Weather highlights for the season are described on the preceding page.

Final orange production at 116,700,000 boxes was 31 percent less than the pre-freeze forecast. Grapefruit production at 40,900,000 boxes was 11 percent less than the October forecast. Grapefruit loss was not as severe because of the large amount of grapefruit in the East Coast growing areas where freezing temperatures were of shorter durations.

FCOJ yield was final at 1.28931 gallons per box. This was 10 percent less than the 1.43 gallons estimated in the October forecast.

California's production of 48,300,000 boxes of oranges was substantially less than the 76,100,000 boxes harvested in the previous season. Grapefruit production was 6,440,000 boxes, slightly less than the 7,300,000 boxes in the previous season.

Arizona orange production at 1,800,000 boxes was substantially less than the previous record high crop of 3,800,000 boxes. Grapefruit production was slightly less than the previous season.

Texas suffered big losses from the December freeze. Final orange production at 2,510,000 boxes was 56 percent less than the previous season. Valencia oranges, which were not sufficiently mature for harvest were almost a total loss. Grapefruit production at 3,200,000 boxes was 71 percent less than the 11,200,000 boxes produced in the previous season.

CITRUS BOX WEIGHTS: Approximate net weight in pounds by fruit type and States

States	Oranges and others 1/	Grapefruit	Tangerines	Lemons	Limes
Florida	90	85	95	90	80
Calif.	75	65	75	76	--
Texas	85	80	--	--	--
Arizona	75	64	75	76	--

1/ Includes Florida Temples and Tangelos at 90 lbs.

TREE CENSUS

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles identify all the State's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineate the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The 1966 survey indicated there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter--1968 through 1984--to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey, conducted after the December, 1983 freeze, indicated 761,365 acres of commercial citrus in Florida. It was not possible to visit all citrus groves in the heavily damaged West Coast and Upper Interior growing areas, so a sample survey was used to estimate the number of trees remaining alive after the freeze. The Lower Interior and East Coast growing areas were surveyed with usual procedures, using ground checking based on changes detected by the aerial photography flown in the winter months.

The gross loss of 159,719 acres since 1982 reflects losses from the freeze as well as normal attrition occurring at the rate of about two percent per year. An undetermined amount of acreage that was alive in the spring of 1984 will undoubtedly be lost as well. Growers had not decided in many instances whether to remain in business or not. During the two year interval 73,228 acres of new citrus was set, partially offsetting the severe reduction due to the December 1983 freeze. Nearly all of the new acreage was set along the southern end of the citrus belt.

Florida, all citrus: Acres in commercial groves as of January, 1966 - 1984, with percent changes

Year	Acres	Change from previous survey	Change from 1966 survey
		Percent	
1966	858,082	---	---
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	-6.7	+2.3
1974	864,098	-1.6	+0.7
1976	852,369	-1.4	-0.7
1978	831,235	-2.5	-3.1
1980	845,283	-1.7	-1.5
1982	847,856	+0.3	-1.2
1984	761,365	-10.2	-11.3

1983-84 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary on-tree value of all citrus for the 1983-84 season is $746,515,000. This is 15 percent less than the revised 1982-83 value of $876,777,000 and 28 percent less than the record high 1979-80 season total of $1,037,050,000.

Preliminary value is based on that part of the crop that was priced at harvest, about 30 percent of the total. When all participation plans and cooperative prices are finalized, a revised value is calculated.

The 1983-84 preliminary season on-tree price of oranges was $4.96 per box, slightly less than the revised 1982-83 price of $5.15 per box. A high proportion of the early-midseason oranges was harvested after the December 25, 1983 freeze and this salvaged fruit brought low per pound solids prices as well as being reduced in solids per box. Processing early-mids returned only $3.65 per box, the lowest in several seasons. The Valencias that remained on the trees after the freeze returned $6.37 per box for processing compared to $5.48 the previous season, reflecting the reduced crop size caused by the Christmas freeze.

Grapefruit prices strengthened after the freeze and the preliminary average was $2.57, up 31 percent from the previous season's revised $1.96 per box. Fresh prices were up slightly, but the major increase was from higher processing returns. All grapefruit for processing returned $1.45 per box compared to $.52 per box in the 1982-83 season.

The 1983-84 season delivered-in price for all priced fruit going into FCOJ was $1.21 per pound of solids as compared to $1.14 per pound in the 1982-83 season. Early and mid varieties were $1.06 per pound and Valencias were $1.42.

FLORIDA, ALL CITRUS: Value of sales on-tree, crop years 1974-75 through 1983-84

Crop year	Value 1,000 dol.	Crop year	Value 1,000 dol.
1974-75	$397,066	1979-80	$1,037,050
1975-76	440,326	1980-81	953,350
1976-77	529,765	1981-82	713,324
1977-78	848,680	1982-83 1/	876,777
1978-79	966,916	1983-84 2/	746,515

1/ Revised. 2/ Preliminary.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared from objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Data on production are obtained from several objective fruit surveys: limb count and size and droppage samples. Because of the statistical sampling design, counties with higher production in general have a greater number of fruit samples, and therefore estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are still more reliable.

PRICES

All on-tree prices represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three percent of a fruit type is harvested, estimates are computed. Fresh fruit sales organizations and a mail-out questionnaire to packers provide the average F.O.B. price, and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales.At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together, by varieties, to determine the final processing price received by growers. From this price, charges for picking, hauling and packing, as determined by University of Florida economists, are deducted to arrive at the final on-tree price received by growers.

FOREIGN EXPORTS

Fresh exports of citrus to countries other than Canada and Mexico for the 1983-84 season totaled 10,038,000 cartons, up slightly from the previous season. Grapefruit, principally to Japan, accounted for over 99 percent of the total exports. Orange exports were down to only 42,000 cartons. Tangerines, mostly to Puerto Rico, decreased slightly to 44,000 cartons and were mostly Honey Tangerines.

Frozen concentrated orange juice (FCOJ) is Florida's major processed product sold in export markets and amounted to 12.8 million gallons in the 1983-84 season. This compared to the 12.5 million gallons exported in the 1982-83 season. Canada is the major market for U. S. exports. Increasing Brazilian production and the severe Florida freeze have limited export expansion opportunities for Florida FCOJ.

FLORIDA CITRUS: Production of all citrus since 1886-87

Crop year	Type of fruit				Crop year	Type of fruit

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p.95) is thought to be the Don Phillipe grove in Pinellas County, planted sometime between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began, Florida's dominance of the Nation's citrus became even more apprarent. In 1983-84, Florida had 70.1 percent of the Nations's production.

Footnote 2/ for page 32, 1/ for pages 33 and 34. Final Mexican shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 32 through 34 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases give separate totals for these two types of citrus. Mexican shipments, through the U.S. to Canada are not included.

ACKNOWLEDGMENT

The acreage, production, and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers, and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production, and price statistics in this bulletin. This report was assembled under the direction of Jerry Campbell, Ron Shannon, and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and Buck Buchanan, Bureau of Market News. The authors also wish to thank Becky Altman, Brenda Craft, Ray Crickenberger, Marcelo Diaz, Kitty Hildreth, Tommy Scherer, Pat Todd, and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

PRINCIPAL VEGETABLES
BY
PRODUCING AREAS

1. WEST
    - A. Escambia county - Potatoes.
    - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
    - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. NORTH
    - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
    - E. Hastings - Cabbage, potatoes.
    - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
    - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. NORTH CENTRAL
    - H. Oxford-Pedro - Tomatoes, watermelons.
    - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
    - J. Webster - Cucumbers, eggplant, peppers.
4. WEST CENTRAL
    - K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
    - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
    - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
    - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. EAST CENTRAL
    - O. Ft. Pierce - Tomatoes, watermelons.
6. SOUTHWEST
    - P. Ft. Myers-Immokalee - Sweet corn cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. EVERGLADES
    - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. SOUTHEAST
    - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
    - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
    - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS—During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

All shipments and unloads, rail, truck, air, and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT—The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question are revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT
Most common unit, estimated net weight, number of units per hundredweight,
principal vegetable commodities, Florida, 1983-84 crop season

Commodity	Unit	Est. net weight	No. of units per cwt	Commodity	Unit	Est. net weight	No of units per cwt
		Pounds				Pounds	
Snap Beans	Bushel	30	3.333	Lettuce	Cwt	100	—

SUMMARY OF THE 1983-84 VEGETABLE SEASON

The farm value of Florida-grown vegetables, melons, potatoes, and strawberries sold in the 1983-84 crop year totaled $1.1 billion, the same as the 1982-83 crop year. Acreage harvested was 3 percent above the previous year. Crops showing the greatest gains in harvested acres were carrots, green peppers, potatoes, radishes, squash, tomatoes, and watermelons. Crops increasing in value were cabbage, celery, eggplant, potatoes, and watermelons. Crops with lower values than the previous year were snap beans, carrots, sweet corn, cucumbers, escarole, lettuce, green peppers, radishes, squash, tomatoes, and strawberries. Except for carrots, most of the declines in value were due to lower season average prices. Cabbage, which rose $18.0 million, showed the greatest increase in value, followed by potatoes which increased $14.4 million; celery, $9.7 million and watermelons, up $3.9 million from a year ago. Tomatoes and green peppers showed the greatest declines, down $22.7 million and $14.9 million, respectively, from the previous year.

Average yields for snap beans, celery, sweet corn, eggplant, potatoes, and watermelons increased during the year but yields declined for cabbage, carrots, cucumbers, escarole, lettuce, green peppers, radishes, squash, tomatoes, and strawberries.

Season average prices for cabbage, carrots, celery, and eggplant were higher than a year ago. Prices for snap beans, sweet corn, cucumbers, escarole, lettuce, green peppers, potatoes, radishes, squash, tomatoes, watermelons, and strawberries averaged below the previous season.

Land preparation, planting and transplanting were very active in most areas during July. Growing conditions were generally good over most of the farming areas in August. Planting activity progressed favorably with very few delays. The weather during September and October was mostly favorable with generally warm days and mild nights. Numerous cold fronts passed through the State in October and November, bringing cooler temperatures and varying amounts of rainfall. Some locally heavy rainfall along the southeast coast delayed harvest and planting.

Temperatures were generally mild during most of December until a severe cold front passed through the State over the Christmas weekend. Nighttime lows reached into the teens in northern counties and 20's in the southern counties. The cabbage crop in the Hastings area was considered nearly a total loss as practically all of the younger acreage was lost to the freeze. Damage to other crops was moderate to heavy in most southern farming areas. Growers in Dade County experienced light to moderate losses as some plants were protected from the cold winds. Another cold front passed through on New Year's weekend but was not as damaging.

Early January was characterized by numerous cold fronts. The southwest had light frost and below normal temperatures, but there was very little damage to crops. Temperatures were generally mild and mostly normal to above normal in the winter vegetable areas throughout the remainder of the month. There was little to no rainfall in most areas.

Rainfall was generally light throughout the State during February. However, locally heavy showers occurred in the southeast and in some west Florida areas. Irrigation was very active in the drier localities. Mostly mild, sunny weather prevailed in the vegetable areas.

A cold front in early March brought lower temperatures to most vegetable producing areas. Strong, cold winds gusting 40 to 50 miles per hour caused light to moderate damage to most tender crops in nearly all areas except Dade County. Heavy, scattered frost blanketed portions of central Florida and the northern Everglades. Little to no damage was reported on most crops, however, sweet corn in the Everglades suffered heavy damage. The remainder of the month was accompanied by ample periods of sunshine and moderate winds. Rainfall accumulations were generally light to moderate during March in most growing areas.

April was fair and dry. No significant amounts of rainfall were reported although some locally heavy showers occurred in the Lake Okeechobee area. In the southwest, some irrigation wells went dry due to a lack of appreciable amounts of rainfall. Temperatures were variable throughout the month. Harvest was in full swing for some crops while others were declining seasonally.

Weather in May continued hot and dry. Rainfall was spotty with many areas receiving small quantities. Constant irrigation was required to maintain soil moisture. Water tables continued to drop in the southwest, putting additional pressure on the irrigation wells. The first substantial rains of the spring season for many areas fell during the last week of May. From 2 to 12 1/2 inches fell between May 26 and the morning of May 29. Heaviest rainfall was in the Pompano area. Harvest was very active for some vegetables but declining for others.

The first week in June was unusually clear, cool, and dry. Record low temperatures occurred during the weekend of June 2nd and 3rd. At midmonth, routine summer weather set in with warm, humid conditions and scattered afternoon, and evening showers and thunderstorms. Most areas received rains of 1 to 3 inches. Temperatures averaged near normal. Harvest was essentially complete for most crops in the major vegetable areas by the end of June.

Most of the weather data for this summary was supplied through the National Weather Service, U.S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS
1983-84

Florida growers produced 4.5 million bushels of bush and pole beans during the 1983-84 season for fresh and processing utilization, up 6 percent from a year earlier. Acreage harvested for fresh and processing totaled 46,500 acres, down 1 percent from the 47,000 acres harvested during the previous season. The average yield for the 1983-84 season was 96 bushels per acre for fresh market and 100 bushels per acre for processing, as compared with 90 bushels and 100 bushels, respectively, for the previous year.

The average f.o.b. price of $9.22 per bushel for fresh market was $1.38 cents lower than the previous year. At $4.50 per bushel, snap beans for processing are up $1.50 from last season. Total value, at $40.0 million, was 10 percent below last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are grown primarily in Dade County, with small acreages in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The northern and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from early October into mid-June. The fall crop peaked in December. Marketings declined sharply in January and February after the Christmas of 1983 freeze. Production for the season peaked in March. Normally, April is the month of peak production. About 21 percent of the fresh marketings were in March.

Variable weather influenced the 1983-84 bean crop. Heavy mid-October rains in the southeast washed beds and leached fertilizer, necessitating moderate reseeding. Ideal growing weather prevailed in most of December until a severe cold front moved through the State over the Christmas weekend. Plant damage was severe in the Pompano area. Some acreage had to be replanted. Strong, cold winds in early March whipped plants, burned tender foliage, and caused some fruit scarring. Weather during the spring season was generally favorable. Heavy rains the end of May again washed beds and leached fertilizer in the southeast, but most growers had completed harvest. Quality and yield were variable thoughout the season.

CABBAGE
1983-84

Florida's cabbage growers produced 4.7 million crates and bags of cabbage during the 1983-84 season. Production at this level is 28 percent less than the previous year and the lowest since the 1964-65 season when 4.6 million crates were produced. The gross value was $40.7 million, a 80 percent increase over the previous year's total of $22.7 million. The average f.o.b. price was $8.75 per crate or bag, up $5.23 from the $3.52 received for the prior season's crop. The higher average price received accounted for the sharp increase in value.

Total plantings were 19,000 acres, up 17 percent from the 16,300 acres planted during the 1982-83 season. However, only 11,000 acres were harvested. This was 25 percent less than last season, primarily because of freeze loss. The average yield of 423 crates or bags per acre was down by 15 bags from the previous season's average.

Cabbage was available for market in late October and continued through June. Production during the fall months was down 6 percent from the previous fall. Production during the winter and spring period was down 29 percent from the year before. The peak months were April and May followed by March.

The Hastings area, which includes the three counties of Flagler, Putnam, and St. Johns, is the leading producing area in the State. This area accounted for 51 percent of the State's production during the 1983-84 season. The leading cabbage producing county is St. Johns with 3,000 acres harvested, or 27 percent of the State's total.

Direct seeding and transplanting got underway by mid-September. The most active period for transplanting was October through December. Direct seeding in fields occurred between August and November. Only a small percentage of the total acreage planted is seeded direct in fields.

First cuttings began in late October, increasing slowly into December. A freeze on Christmas weekend brought extensive damage to the cabbage crop. Production dropped sharply after the first of the year and did not gain momentum until March. Harvest was at peak during April and May. Effects of the freeze lowered yield and production for the winter quarter. Winter production accounted for only 26 percent of the total production, down considerably from the 1982-83 winter months. Many growers replanted damaged fields for harvest in the spring. Spring production accounted for 65 percent and fall months 9 percent.

CARROTS
1983-84

Production of carrots in Florida for fresh market and processing utilization during the 1983-84 season totaled 730,000 cwt, down 34 percent from the previous season. Fresh use constituted 79 percent and processing 21 percent. This compares with 80 percent fresh and 20 percent processing the previous year. Approximately 20 percent of the fresh carrots were mini or finger carrots compared with 19 percent a year earlier. The remaining 80 percent were the regular type carrots.

There were 10,600 acres harvested from the 12,000 acres planted during the 1983-84 crop year. This compares with 10,000 acres harvested from the 10,600 acres planted a year earlier. Average price received for the 1983-84 crop was $14.60 per cwt compared with $10.50 per cwt the previous year. Total value was $10.7 million, down 8 percent from the $11.6 million for the 1982-83 crop year.

The muck soils around Lake Apopka, near Zellwood, and in the Everglades area south of Lake Okeechobee provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October or early November and ends by late May. Regular size carrots are harvested from November through June. The young crop in the Zellwood area received extensive cold damage from the Christmas 1983 freeze. Considerable acreage had to be replanted for the spring season. Generally,size and quality were good during most of the harvest period.

CELERY
1983-84

Florida celery marketings of 6.2 million crates were harvested from 9,200 acres during the 1983-84 growing season. The average yield of 672 crates per acre compares with 666 crates the previous year.

Prices averaged higher than the previous year and at $10.44 f.o.b. per crate, compared with $8.77 per crate during the 1982-83 season. Prices during January, February and March averaged higher than the same months the previous year while prices during April through December averaged lower than the previous year.

The Everglades, with 82 percent of the harvested acreage in the State, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota area, accounted for the remaining 18 percent of acreage and provided continuous supplies during the season.

Plant bed preparation and seeding were underway by mid-June. Transplanting was underway in August and became active by mid-September. Plantings in the Everglades were winding down by the end of March and were completed by early April. Plantings were also complete in the north central area by the first week of April. Growers in the Sarasota area usually plant from October to March.

Light harvest began by mid-November in the Zellwood and Everglades areas. Growing conditions were hot and humid in the summer and early fall months. Cool weather in November was beneficial for growth and development. Quality was generally good during most of the season. Yields and size were good and averaged about normal.

No major cold damage occurred to the celery because of the Christmas 1983 freeze. The winter market was very favorable but prices averaged below the previous spring when the market was good. Prices overall averaged above year earlier levels. Approximately 3 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good quality celery.

Celery production was most active from December through May with April being the peak month. Cutting was completed in all areas the first week of July.

Celery is subject to a Federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the Celery Committee, these data are assembled into weekly, monthly, and annual reports and published in this Annual Summary.

CHINESE CABBAGE
1983-84

Chinese cabbage is grown primarily on the mucklands of the Zellwood and Everglade areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by late November. Volume was below normal in January and February because of the severe Christmas 1983 freeze and then peaked in March. Good supplies were available into May. During April and May, Zellwood was providing good supplies while the Everglades was winding down for the season. Light supplies were available into June. Quality was generally good during most of the growing season. Shipments for the season totaled 115,000 cwt compared with 129,000 cwt a year earlier.

SWEET CORN
1983-84

Florida, the Nation's leading sweet corn producer for fresh sales, marketed 10.9 million crates during the 1983-84 season. Production decreased 3 percent from the previous year. Harvested acres totaled 55,200 compared with 57,700 harvested the previous year. Yields averaged 198 crates per acre, up 2 crates from the previous crop year.

The season average f.o.b. price of $5.58 per crate was 16 cents below the $5.74 per crate average in the 1982-83 crop season. Sweet corn ranked sixth in value of vegetables produced in the State and was exceeded only by watermelons, celery, potatoes, green peppers and tomatoes.

First plantings of the season were underway in the Everglades and Zellwood areas in July. Seeding on the East Coast got underway in early October. First harvest began in the Zellwood area after mid-September. Cutting in the Everglades got underway by mid-October. Harvest was virtually complete in December when freezing temperatures entered the area on December 25. Harvest then shifted from the Everglades to the southeast coast in December. The Christmas freeze caused moderate to heavy damage to the older plantings in the Pompano area. Volume was reduced for 4 to 6 weeks. Acreage loss was very light. By mid-January Dade County began light harvest.

A cold front in early March brought freezing temperatures to the Everglades. Older corn away from Lake Okeechobee received heavy damage. Considerable acreage had to be replanted. April harvest was below normal and supplies did not reach a peak level until mid-May. The Everglades became the main source of supply in late April as the East Coast and Dade County were nearing the end for the season. Spring harvest got underway in mid-May in the Zellwood area. Volume declined seasonally in the Everglades by early June and the Zellwood area became the main source of supply into early July. The season was over by mid-July.

A small acreage continued to provide supplemental supplies from Zellwood and the west central area during the early fall and from Sarasota in the early spring.

Weather during the growing season was marked by freezes during December and March. The older crop on the southeast coast area had moderate to heavy losses from the Christmas weekend freeze. Considerable acreage loss occurred in the Everglades after the March freeze, necessitating much of the crop to be replanted. Yields were also reduced by the adverse conditions. Growing conditions after the March freeze were generally favorable. Quality and ear size improved as the season progressed into early spring.

CUCUMBERS
1983-84

Florida's production of cucumbers for fresh market during the 1983-84 crop year was 4.6 million bushels, down 2 percent from the 1982-83 crop. The 16,000 acres planted for fresh market was up 100 acres from the previous year. Fresh market harvested acres totaled 15,100, also a gain of 100 acres from a year earlier. Average yield per acre for fresh market, at 307 bushels, was down 9 bushels from the previous season. Total fresh market production was valued at $34.0 million compared with $37.0 million for the 1982-83 season. The fresh market price for 1983-84 averaged $7.33 per bushel compared with $4.77 the previous year.

Supplies in 1983-84 were generally available from September through June, with light marketings January through March. Many of the recorded shipments moving out-of-State January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the State. The southwest area, with 42 percent of the planted acreage during 1983-84, is the largest area. The west central area accounted for 28 percent of the planted acres in the State. The west, north central, and southeast areas provide the remaining crop.

The crop was mostly in good to very good condition during the fall. A severe December freeze killed the remaining fall crop. Damage was heavy to young plantings. Considerable replanting was necessary. Strong, cold winds in March caused heavy plant damage to some fields. The spring cucumber crop in the Immokalee area was set back by the adverse weather. In early April, heavy rain and strong winds rolled vines and scarred fruit in the Pompano area. Remaining spring weather was warm and dry. Yields, size, quality, and color were very good during the fall but variable throughout the spring season.

EGGPLANT
1983-84

Plantings totaled 2,300 acres, down 11 percent from the 1982-83 season. Yields averaged 710 bushels per acre compared with 666 bushels for the previous season. Weather was generally favorable during much of the fall, and crop progress was good. During late December a hard freeze resulted in heavy plant damage but only light acreage loss. Mild, sunny weather in February was favorable for plant recovery but production was light because of earlier freeze damage. Conditions remained favorable for growth until strong, cold winds whipped plants, scarred fruit, and burned tender leaves in early March. Crop condition was mostly good in the spring after plants recovered from the March freeze. Quality, size, and yields were generally good.

Production of eggplant decreased to 1,491,000 bushels, 10 percent below last year's production. Total sales increased to $8.7 million compared with $8.4 million a year earlier. The increase was due to a higher yield per acre and price per bushel because harvested acres decreased from 1982-83. The season average price of $5.84 per bushel is 78 cents higher than a year ago. Compared with a year earlier, prices for most months were higher, particularly for the fall and winter months.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November and dropped during the winter. Harvest began to increase in April and reached a peak in May. Harvest was virtually complete by July. The southeastern area around Pompano accounted for 58 percent of the harvested acreage. The northern and central areas combined contributed about 31 percent of the acreage harvested with the remaining acreage in the southwest.

Production is generally continuous throughout the entire crop year in the southeast and southwest. The crops in the western, northern, and central areas are for fall and spring harvest only because these areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern areas in late September. Harvest followed the ususal pattern and progressed southward in the fall, continued through the winter in the southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE
1983-84

Production of escarole and endive during the 1983-84 season totaled 2.9 million crates, the same as a year earlier. The 5,700 acres harvested were up 2 percent from the previous year. Yield per acre averaged 505 crates compared with 519 crates the previous year.

Prices during the season averaged $4.92 per crate, compared with $5.17 a year earlier. The total value of sales, at $14.1 million, was 6 percent below the previous year. The Everglades, which had 68 percent of the harvested acreage in the 1983-84 season, began seeding in late August. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous into early June. The mucklands around Zellwood provide good volume in the late spring months. The small acreage grown around the Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to a good volume by November. Marketings reached peak levels in the December through April period. Sales were complete for the season by early June.

The December freeze slowed growth and damaged the outer leaves of plants. The central area sustained moderate crop losses, reducing supplies for several weeks. Growing conditions for the remaining period were generally favorable. Quality of escarole was mostly good during the season.

LETTUCE
1983-84

Florida lettuce growers produced 2.3 million cwt during the 1983-84 season, down 5 percent from the previous year. A slight increase in harvested acres along with a 6 percent decrease in yields resulted in the decline in production. Average yield of 179 cwt per acre compares with 190 cwt per acre for the previous season. Growers harvested 13,000 acres compared with 12,900 acres the previous year. The season average f.o.b. price of $16.84 per cwt was below the $18.83 per cwt received the previous year. Monthly prices through February were above a year earlier. Beginning in March, prices averaged less for the remaining winter and spring season.

Acreage, production, and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, romaine, Boston, bibb, and leaf.

The Everglades muckland accounted for 86 percent of planted acreage and was the source of a continuous supply of good quality lettuce which began in early November and ended in late May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during most of the season.

Seeding was underway in mid-September. All areas were actively planting by early October. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway by late October and continued light until mid-November. Volume gained significantly in December with growers cutting in most areas. The Everglades continued to provide the bulk of the volume during the winter period. Virtually all of the iceberg type is grown in the Everglades. Supplies peaked in March and declined to the season's end by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring season.

Growing conditions in the early fall were hot and humid. However, growth was rapid. Freezing temperatures during December caused some light to moderate damage to outer leaves in the Everglades. Extensive damage occurred to young foliage in the Zellwood area. Supplies were reduced in both areas. Heavy volume was available statewide in February and March. Quality was generally good throughout the season.

PEPPERS
1983-84

Florida produced 9.7 million bushels of peppers during the 1983-84 season, an increase of 2 percent from the previous year. The average yield of 467 bushels per acre was 3 percent below the 482 bushels per acre last season. Harvested acreage, at 20,700 acres, was 5 percent more than the 19,700 acres harvested in 1982-83.

The season average f.o.b. price of $7.75 per bushel was down from an average of $9.45 for the previous season. The total value of $74.8 million was 17 percent below the previous year. Prices were below last year except for October through December. Marketings were light in October but increased to a good level by December. Supplies decreased during the winter months but began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

Total planted acreage increased 7 percent over the previous season. Increases in acreage for the north, west central, and southeast areas were partially offset by decreases for the north central and southwest areas. The southeast accounted for 38 percent of the State's total pepper acreage. The southwest had 33 percent; the north, 12 percent; the west central area, 9 percent; and the north central area, 8 percent.

During September, hot weather necessitated spot replanting to restore stands to normal. Conditions during the remainder of the fall season were generally favorable. A hard December freeze damaged fruit and top foliage. Damage was very heavy on the older plants. Salvage operations, replanting, and planting were extremely active after the freeze. Cold winds in early March produced light to moderate leafburn on some young fields and lowered crop conditions. Most plants recovered well from the adverse weather. Spring weather conditions were generally favorable. Yields and quality were mostly good.

POTATOES
1983-84

Potato production in Florida during 1984, including both winter and spring, totaled 7.9 million cwt, 32 percent more than the 1983 crop. A total of 34,900 acres were planted for 1984 harvest. Out of this total, 33,600 acres were harvested, about 7 percent more than the acreage harvested in 1983. The value of the crop was placed at $70.2 million, up 26 percent from the previous year. The increase in value of production is attributed to an increase in harvested acreage and yield for both the winter and spring crops. The season average price decreased slightly but the increase in total production compensated for the decrease in value. The price received for all potatoes averaged $8.90 per cwt compared with $9.25 in 1983.

The average yield was 236 cwt per acre, 43 cwt above last year. In the Hastings area which includes Flagler, Putnam, and St. Johns counties, the average yield was 260 cwt per acre, up 45 cwt from last year. Spring potatoes grown in other areas of the State had an average yield of 200 cwt per acre. This was a sharp increase from the 155 cwt average of 1983. The winter crop averaged 160 cwt, up 20 cwt from the 1983 winter season.

The "red-skinned" varieties are the dominant variety grown for winter harvest in south Florida. Most of the winter crop is sold for table stock but a few are sold to the potato chip industry. In the Hastings area, the "white-skinned" varieties dominate. Most of the Hastings production goes to the potato chip industry, although fresh market or table stock sales are increasing in importance.

The winter potato harvest was underway in January and progressed through March and April. Winter harvest was very active in April. Harvest of the spring crop in the Hastings area got underway in mid-April with peak harvest in May. Digging continued into June and then declined sharply about midmonth. Abandonment was about normal throughout the season. The winter crop suffered some light damage but the plants recovered to produce very good yields.

SPINACH FOR PROCESSING
1983-84

Spinach statistics have not been published separately for Florida in recent years to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetable" series shown in this publication. Data for 1973 and earlier are available upon request. Yields per acre and harvested acres declined because of freezing temperatures during the Christmas weekend of 1983. Most of the crop is grown in the north central area.

SQUASH
1983-84

Florida's production of squash during the 1983-84 season, at 3.0 million bushels, was 4 percent above last year. The total of 16,800 acres harvested increased 4 percent from the previous year. The yield, at 177 bushels per acre, was down 2 bushels from last year.

The season average price of $10.12 per bushel was down $1.00 from the 1982-83 season. Total cash receipts amounted to $30.2 million. Monthly prices were below a year earlier except for January and February.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with 33 percent of the State's harvested acreage in 1983-84, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the State. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and mostly confined to local markets. The 1983-84 season got off to a good start. Marketings increased to a fall peak in November and early December, then declined seasonally during the winter months. A severe freeze in late December killed nearly all plants above ground in the southwest and Pompano areas. Light to moderate plant damage occurred in Dade County. Most fields destroyed by the cold weather were plowed up and replanted. During March, cold temperatures and strong winds slowed growth and caused some foliage burn to both young and old crops. Weather was favorable during the spring quarter although there was some foliage burn and fruit scarring. Peak marketings for the season occurred in April.

RADISHES
1983-84

In the 1983-84 crop year, radish plantings amounted to 28,800 acres compared with 27,400 acres planted during the previous year. Acres harvested totaled 25,400, 3 percent above the 1983-84 season. Yield per acre averaged 207 cartons compared with 247 cartons a year earlier. The crop was valued at $23.0 million, down $4.9 million from the previous record a year earlier. The average f.o.b. price was $4.36 per carton, down 22 cents from the 1982-83 season.

A good supply of both red and white radishes was available from Zellwood, Lake Placid, and the Everglades from October through May with a light volume going into June. The peak fall harvest occurred in December. The spring peak occurred in March. Seeding of the 1983-84 crop was underway in the Everglades and north central areas in early September. Early crops progressed very favorably. Light harvest was underway in early October and became quite active in November. In December, some acreage was lost from a hard freeze. As a result of the cold weather, replanting was necessary and packout was reduced for several weeks. Supplemental supplies were available from Lake Placid and Sarasota during the year.

STRAWBERRIES
1983-84

Florida strawberry growers produced 7.2 million flats of berries during the 1983-84 season, down 15 percent from the previous year. Harvested acreage totaling 5,100 acres decreased 6 percent from a year earlier. Average yield of 1,417 flats per acre decreased from the 1,583 flats a year earlier. The f.o.b. return per flat for the season was $5.38, a decrease of 76 cents per flat from the previous season. The value of the crop was $38.8 million, down $13.7 million from the $52.5 million received a year earlier.

Laying of plastic and other field work was in full swing by late September in the important Hillsborough-Manatee area. Transplanting began by mid-October and increased rapidly for several weeks. Transplantings were virtually complete by early November. Light harvest was underway by mid-December in the Plant City and Dade areas. Shipments began in December but were prevented from gaining momentum by a severe freeze over the Christmas holiday weekend. Most growers used sprinklers to protect plants from the cold temperatures, but strong winds kept plants from icing over. Extensive damage was received by the crops in Bradford County and the Hillsborough-Manatee areas. Yields were greatly reduced. Plant recovery from the cold was slow but quality and harvest improved by mid-February. Market prices in January were higher than a year earlier while prices in February through April were lower. Peak movement occurred in March. Harvest was underway in Bradford County by early April and the season was drawing to a close around late May. Most of the acreage in Dade County was for U-Pic and roadside stand operations.

TOMATOES
1983-84

The total value of the Florida tomato crop for fresh market and processing was $368 million, down 6 percent from the record value in the 1982-83 season. The average price received for fresh tometoes was $6.83 for a 25-pound carton, 56 cents lower than the previous season. This was a contributing factor to the lower value for the crop.

Total production of 55.1 million 25-pound carton equivalents was up 2 percent and a new production record for the State. Tomatoes utilized for the fresh market amounted to 98 percent of the total and the remaining 2 percent went to processors. The processing segment is a secondary utilization, usually following the fresh market harvest. The Palmetto-Ruskin area accounted for 39 percent of the total production and Dade County 24 percent. The southwest had 24 percent, Ft. Pierce-Pompano, 9 percent and the remaining 4 percent was produced in the north, north central, and western areas of the State.

The average yield for the State was 1,128 (25-pound) cartons, down 26 cartons from the year before. Demand for Florida tomatoes was good during most of the season. Winter production was below normal as a result of a hard freeze in December. The southwest area suffered heavy losses to plants ready for harvest. Dade County, which leads in winter production, had no major damage from the freeze. The fall shipments peaked in December with 16.0 percent of the total production. January was the peak month during the winter season, accounting for 9.8 percent. January and February production was below normal due to the freeze in December. The spring production peaked in May with 23.2 percent of the total. Tomatoes are harvested from late October to early July.

Tomato planting got underway in July in all areas except Dade County where growers started during the middle of September. Planting made good progress during the fall as the weather was mostly favorable. In December, a freeze caused damage to tomatoes, mostly in the southwest. The other areas were spared any major damage. The Palmetto-Ruskin area experienced strong, cold winds in early March, causing moderate damage to their crops. Some fields had to be replanted. Recovery was quick after the adverse weather in the winter months. The tomato crops were in good condition by spring and production continued back on schedule. Harvest was complete by mid-June in the southernmost areas but light harvest continued through June into early July in the other areas.

WATERMELONS
1983-84

Watermelon acreage planted during the 1983-84 season totaled 64,000 acres--an 8 percent increase from the 1982-83 period. Of the total acres planted, 60,000 acres were harvested. This was 22 percent more than the previous season. The crop of 10.0 million cwt was 24 percent above last season's production of 8.1 million cwt. The average yield for the State was 167 cwt per acre, up 1 percent from the previous year. The area yields were rather variable, ranging from 135 cwt in the Panhandle to 190 cwt in the south.

The average price received was $6.20 per cwt, down 1 dollar from last season. Prices received by growers for melons were highest in the south and west central area where the harvest begins early. The total value of the crop was placed at $62.1 million, a new record for the State. This was 7 percent above the previous record set last year.

The watermelon harvest got underway by late April in the Immokalee area. The season progressed northward into the central area during May and the northern areas in June and came to an end in the western counties by mid-July. As usual, June was the heaviest shipping month during the 1983-84 season.

Light plantings were made in the Immokalee area during late December. A Christmas freeze burned plant leaves and killed some plants in a few early spring plantings. The freeze also ended production in the same area from a small acreage planted in the fall. Cold, windy weather during early March damaged the crop in the southwest and delayed growth in the west central area. Fields that were set back by the weather made good recovery. A combination of heavy rains and strong winds in April hurt the crop in the west and northern areas, lowering yields.

Harvest continued into July in both the north and west. Harvest continued active in July but volume was below normal. The season was over in all areas by the end of July.

OTHER CROPS
1983-84

Cantaloups are grown in Florida primarily in the spring and summer in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. Some cantaloups also are grown during the fall months in the southwest and west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee, and Everglades areas. Acreage increased from a year earlier. Supplies are available from December to April. At the present time statistics are not available for publication. Shipment information is recorded by Market News Service. In the 1983-84 season there were 74 thousand cwt (391 thousand 22-pound cartons) shipped out of the State compared with 86 thousand cwt shipped the previous season.

Tropical vegetable production during the 1983-84 season decreased from the previous year primarily because of lower yields. The December freeze was a contributing factor to the lower production. Acreage harvested was up 1 percent from the previous year. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for various vegetables are shown in parentheses. The crops consist primarily of boniato-Ipomea batata (sweet potato); calabaza-Cucurbita (pumpkin); malanga-Xanthosoma caracu or Colocasia esculenta (dasheen, vautia); and cassava-Manihot esculenta (crantz, yucca, topioca). The boniato, Calabaza, and Malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 11,000 acres of tropical vegetables planted in the 1983 calendar year. Peak production of malanga occurs in February through April. Efforts are being made to provide more even supplies throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabaza are being brought in from Columbia, South America to select those that do best in south Florida. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of State are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard, and other greens are grown throughout the State and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available from November through March. Shipments totaled 75 thousand cwt during the 1983-84 season, 33 thousand cwt more than a year earlier.

Okra is grown in many areas of the State during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other States. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other States. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the State.

Parsley is available in both the curley and plain types. The bulk of the commercial volume shipped to other States is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid, and other areas.

Southern peas are grown primarily in the northwest, west central, and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-State markets show 33 thousand cwt for fresh market during the 1983-84 season.

Watercress is available the year around. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local State farmers markets, especially the Sanford market.

DOYLE CONNER
COMMISSIONER

Dear Friend:

The Florida livestock industry is a major contributor to the State's agricultural economy. Nationally, Florida ranks ninth in the number of beef cows and first in all States east of the Mississippi River. During 1984, Florida cattlemen east and south of the Suwannee River shipped 438,000 calves to 29 States.

Accurate information is vital for making sound decisions on production, marketing and other agribusiness matters. The statistical data in this publication are designed to help meet these needs. We trust that you will find this report a valuable aid.

The basic data for this publication are furnished by voluntary reporters from the livestock industry. A hearty thanks to all who contributed information which made this bulletin possible. The data are compiled through the cooperation of the Florida Department of Agriculture and Consumer Services and the U. S. Department of Agriculture.

Sincerely,

Doyle Conner

ACKNOWLEDGMENT

Many livestock producers and ranchers, slaughterers, auctions, feed lots, and other agencies associated with the livestock industry offered suggestions or voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The inventory, production, slaughter, utilization, monthly and annual average price, and livestock value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other livestock producing States are from official reports of the USDA Statistical Reporting Service. Information on shipments, auction market prices, and special feeder sales are from cooperative work between the Florida Department of Agriculture and Consumer Services, Livestock Market News Section and the Divisions of Inspection and Animal Industry, and the USDA's Market News Branch, Agricultural Marketing Service.

LIVESTOCK SUMMARY

Cattle and calves

Florida's January 1, 1985 inventory of all cattle and calves totaled 2,190,000 head, down 6 percent from 1984 but continued to rank 16th in the Nation. Nationally, the inventory of 109.8 million head is down 3 percent. The decline continues the recent downward trend in cattle inventories begun two years ago.

Florida's beef cow herd, which decreased 6 percent from last year, totaled 1,325,000 head. Florida continues to rank 1st in beef cows in all States east of the Mississippi River and 9th nationally.

Stocker calves shipped out of Florida by truck from areas east and south of the Suwannee River during 1984 totaled nearly 438,000, down 17 percent from 1983. Texas, Oklahoma, California, Mississippi, and Alabama received 82 percent of the stocker calf outshipments. Rounding out the top 10 States were Arizona, Kansas, Georgia, New Mexico, and Arkansas in that order with 15 percent of the total.

Cattle in Florida feedlots on January 1, 1985 totaled 90,000 head, up 12.5 percent from January 1, 1984.

Hogs on farms

The December 1, 1984 Florida inventory of hogs and pigs was estimated at 160,000 head, 16 percent less than a year ago. The breeding hog inventory was down 20 percent while the inventory for market was down 15 percent.

Cash receipts

Cash receipts from cattle and calves marketed by Florida cattle producers during 1984 totaled $373,133,000, up 4 percent from 1983. Total pounds marketed were 5 percent above 1983 and accounted for most of the increase in receipts. Calf prices were down $2.80 per cwt, but cattle prices were up $1.70 from a year ago.

Cash receipts from hog marketings totaled $27,088,000, down 26 percent from 1983. A sharp drop in marketings and lower prices contributed to the decrease. Marketings were down 25 percent and price was off by 60 cents per cwt from last year.

Bees anb honey

Due to budgetary restraints, the bee and honey estimating program was dropped in 1982. Only historical data are included in this summary.

Sheep and lambs

Florida estimates for sheep and lambs were discontinued after January 1978.

Survey methodology

Primary data used in making cattle inventory estimates in this summary were obtained from probability surveys. Nationally, these surveys include approximately 70,000 farming operations heavily weighted to include operations having cattle. Information is collected by mail, telephone and personal interviews. Since all operations with cattle are not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about one percent at the national level for cattle inventory. This means that chances are approximately 95 out of 100 that a survey estimate will be within two percent of the complete coverage value if the same procedures were used to survey all producers. In Florida, approximately 1,400 cattle producers were surveyed with most of the large farms and ranches included in the count. As would be expected, the relative standard error for Florida and other states is greater than at the national level because of the smaller number of farms in the state samples.

Survey estimates are also subject to non-sampling errors such as omissions, duplications, recording and processing the data and mistakes in reporting. These errors cannot be measured directly, but they are minimized through rigid quality controls on the data collection process and a careful review of all reported data.

In setting the inventory estimates, survey information on births and deaths is used as well as inventory numbers. The survey results are combined with reliable data from other sources on slaughter, imports and exports to construct national and state balance sheets, which provide an additional check on survey inventory estimates.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's poultry industry. It is intended for the use of poultrymen, allied industries and all others who are interested in poultry production.

Many producers, hatcherymen, marketing agencies and others voluntarily supplied information used to develop these statistics. Their cooperation is sincerely appreciated.

This summary is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Market News, Division of Marketing and the Poultry and Egg Section, Division of Inspection. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

Published July 1985

Poultry and Egg Summary

Cash Receipts

Florida cash receipts from broilers, eggs and other poultry products in 1984 totaled $284.4 million, up 22 percent from the 1983 total of $233.3 million. The 1984 receipts from eggs totaled $155.1, up 26 percent, broiler sales totaled $126.1, up 18 percent, and other poultry product sales amounted to $3.1 million, up 9 percent from the previous year.

The annual average price per pound of 32.0 cents, an increase of 4.5 cents from 1983, was the major factor in the increase in total broiler sales. The 1984 annual average egg price of 64.0 cents per dozen was 14 cents per dozen higher than in 1983.

Inventory

Broilers raised during 1984 at 96,150,000 birds, was down 1 percent from a year ago. Layer numbers during 1984 averaged 11,896,000, slightly higher than the 11,865,000 in 1983.

Production

Florida broiler production in 1984 totaled 394,215,000 pounds, 1 percent above 1983. The increase in production was due to heavier weights of broilers marketed as the number raised was less than last year. Egg production totaled 2,912,000,000, down 2 percent from the year before. Eggs per layer averaged 245 during 1984 a decrease of 5 eggs per layer. This was the main cause for the decrease in egg production during 1984.

Commercial hatcheries produced 152.1 million straight run chicks in 1984.Broiler-type chicks accounted for 77 percent of the total and egg-type 23 percent.

Terms and Definitions

MARKETING YEAR--Poultry production, price and value statistics since 1970 are for the marketing year beginning December 1 through November 30. All statistics prior to 1970 are on a calendar year basis. For comparability, in those tables where monthly data are shown, December entries always refer to the preceding year. All hatch and hatchery placement data are reported on a calendar year basis.

BROILERS are meat-type chickens raised commercially and usually marketed in 7-8 weeks.

EGGS include both table and hatching eggs. Table egg prices are calculated on a farm basis, cases exchanged. They include all grades and sizes, but exclude charges for hauling, grading or packaging. Prices for hatching eggs are not published separately. Annual egg production, price and value statistics are for table and hatching eggs combined.

OTHER POULTRY cash receipts include chickens other than broilers, turkeys and miscellaneous farm poultry products.

CASH RECEIPTS are the returns received by farmers for all sales.

GROSS INCOME includes cash receipts plus the value of home consumption.

CURRENT YEAR data are preliminary and subject to revision.

SURVEY METHODOLOGY--Estimates for hens and pullets of laying age, pullets not yet of laying age, and of egg production are based upon data obtained from a sample of commercial chicken and egg producers. This sample is selected from the universe of Florida poultry management units, and includes approximately 80 percent of the total commercial laying flock. Estimates are expected to be within five percent of the value obtained if a complete enumeration were undertaken each month.

During December of each year all known commercial egg producers in Florida are contacted. This complete enumeration establishes the annual universe of management units. Management units include all independent producers as well as contractors who report for all contractees.

1/ Poultry-feed price ratios are expressed in terms of the number of pounds of poultry ration equal in value at local market prices to a dozen eggs, or a pound liveweight of broiler.

Average prices paid by farmers for poultry feeds:

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's dairy industry. It is intended for the use of dairymen, allied industries, and all others who are interested in dairy statistics.

Many dairy producers, marketing agencies, Federal Order Market Administrators, and others voluntarily supplied basic data used to develop these statistics. Their cooperation is sincerely appreciated.

This report is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Dairy Farm Inspection, Division of Dairy Industry. Shipment data are from the Road Guard Bureau, Division of Inspection and Bureau of Dairy Laboratories, Division of Dairy Industry. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

DAIRY SUMMARY

On January 1, 1985, cows kept for milk production on Florida farms and commercial dairies numbered 164,000 head, down 14 percent from the previous year. The combined total of milk cows and replacement heifers, weighing 500 pounds and over, was 208,000 head, an 11 percent decrease from January 1, 1984.

Florida dairies produced 1,898 million pounds of milk in 1984, down 10 percent from the record production of 1983. Production per cow averaged 11,035 pounds in 1984, 28 pounds less than the year before.

Cash receipts from marketings of Florida milk in 1984 totaled $304,398,000, a decrease of 12 percent from 1983. Milk marketed by producers averaged $16.20 per hundredweight in 1984 compared to $16.50 in 1983.

The United States 1984 annual average number of cows was 10,840,000 head, 2 percent less than the annual average during 1983. Milk replacement heifers on farms January 1, 1985 numbered 4,757,000 head, 5 percent more than the year before.

Total milk production in the United States was 135.4 billion pounds during 1984, 3 percent less than the 1983 production. Milk production per cow averaged 12,495 pounds, down 90 pounds from the record output during 1983.

Farmers' cash receipts from marketings of milk in 1984 were $17,927 million for the Nation, a 4 percent decline from the 1983 record of $18,757 million.

ACKNOWLEDGMENT

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under USDA programs. Others contributing information were the Florida Department of Agriculture, the Agricultural Experiment Station and Cooperative Extension Service, University of Florida.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, USDA, Florida Department of Agriculture; and Agricultural Experiment Station, University of Florida. Acreage, production, and value data are official statistics assembled under the direction of Jerry D. Campbell, and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service.

INTRODUCTION AND SUMMARY OF THE 1984 FIELD CROPS SEASON

INTRODUCTION

This publication, released annually, contains statewide estimates of acreage, yield, production, and value of production for all major field crops grown in Florida. The period covered for these crops is from 1974 through 1984. County data for the important producing counties which grow corn, soybeans, sugarcane, peanuts, tobacco, and cotton are published for the years 1983 and 1984. Some county estimates for 1980 and 1981 have been revised from those published previously for certain crops because of changes in total acreage or production resulting from the review of the 1982 Census of Agriculture. The complete series of crop estimates dating back to 1919 for the State are available upon request, as well as revised county estimates for 1980 and 1981.

Crop estimates are available for aiding Florida farmers, bankers, credit organizations, transportation officials, research workers and others in the agri-business community to evaluate trends, consider current and future needs in agriculture, and achieve optimum resource use.

SUMMARY, 1984 SEASON

Temperatures during the early months of 1984 averaged below normal but no damaging freeze occurred after the Christmas freeze of 1983. Heavy rains brought surplus moisture in many areas of the State during the winter months and early spring. The wet soils, combined with below normal temperatures, delayed land preparation and planting of field crops. Once planted, early crops did well as growing conditions were good until late summer. Drought conditions from September to early November severely damaged late corn and second crop soybeans. The dry weather during late summer and early fall was near ideal for harvesting crops. Harvesting was completed earlier than normal--by the end of November for most crops. The 1984 crop yields were good with record yields for, tobacco, potatoes, cotton, and hay. Prices received were lower than in 1983 except for peanuts and tobacco which had slight increases.

Area planted to corn in 1984 totaled 250,000 acres, 49 percent more than 1983 when many growers participated in acreage reduction programs. Of the total acres planted, 210,000 acres were harvested for grain, 72 percent more than the year before. The average yield was 65 bushels per acre, down 2 bushels from the previous year. Drought damage to late corn that was not irrigated was the primary cause of the yield reduction as most of the early crop and irrigated corn produced good to excellent yields. The average price per bushel was $3.05, down $.75 from the previous year. The value of corn produced for grain was placed at $41,633,000, up 34 percent from the year before.

The total area planted to soybeans in 1984 was 340,000 acres, up 4 percent from 1983. Soybeans remained as the State's leader in total acreage planted. There were 325,000 acres of soybeans harvested, up 4 percent from the year before. The average yield per acre was 24 bushels, down 1 bushel from 1983. Season average price was down sharply from 1983, averaging $6.20 per bushel. The value of the soybean crop was placed at $48,360,000, 24 percent below the year before. The decrease in value is due to the lower price as production was unchanged.

The area of sugarcane harvested for sugar and seed totaled 387,000 acres, 5 percent more than the previous season. Of this total, 371,900 acres were harvested for sugar and the remaining 15,100 acres were harvested and used for seed. The average yield was 32.6 tons of cane per acre, 1.2 tons above the season before. Cane production for both sugar and seed totaled 12,617,000 tons, up 9 percent from the previous season. The value of production for the 1984 sugarcane crop will be available in January 1986. The value of the 1983 crop, for sugar and seed combined, was placed at $330,387,000, down 7 percent from 1982. Florida continued as the leading State in the production of raw sugar, producing 1,412,000 tons. Blackstrap molasses, 80° Brix, produced from the 1984 crop totaled 85,409,000 gallons, up 10 percent from the previous season. Mature and young cane suffered some damage from the late January freeze. Weight limitations on wagons carrying cut cane to the mills were lifted by the State and harvesting advanced rapidly.

Hay production totaled 696,000 tons, up 1 percent from 1983. Hay, including all kinds, was harvested from 240,000 acres, 6 percent less than 1983. The average yield was 2.9 tons per acre, an increase of 20 tons from the year before. The price received by farmers averaged $71.00 per ton, $3.50 less than the 1983 price. The total value of all hay produced was $49,416,000, down 4 percent from 1983.

Peanut acreage increased sharply in 1984, when a record 85,000 acres were planted, 23 percent more than the previous year. Of the total peanuts planted, 77,000 acres were harvested for dry peanuts. The remaining 8,000 acres were used for all other purposes but mostly for "green peanuts" for boiling. Yield per acre at 3,200 pounds was 420 pounds above 1983 but below the record of 3,270 pounds set in 1979. Prices were slightly above 1983 and averaged 26.6 cents per pound. Value of the crop, at $65,542,000, rose 60 percent from last year and set a record high.

The production of flue-cured tobacco (type 14) totaled 17,920,000 pounds, up slightly from 1983. There were 7,000 acres harvested in 1984, down 800 acres from the year before. A record yield per acre of 2,560 pounds was 300 pounds more than produced in 1983. The value of the State's tobacco crop was $32,328,000, up 7 percent from the 1983 crop. The average price for all grades sold was $1.804 per pound, up from the $1.714 received in 1983.

The total area planted to cotton in 1984 was 17,500 acres, up 40 percent from the year before. Of this total, 17,000 acres were harvested. The average yield in 1984 was 847 pounds of lint cotton per acre, 239 pounds more than a year earlier and a record high yield for the State. Total production in 480 pound net weight bales was 30,000 bales, a new record and 97 percent greater than 1983. The average price per pound of 58.6 cents was well below the 1983 price of 67.3 cents. The value of production was placed at $8,438,000 compared with $4,910,000 in 1983.

Utilized production from the 1984 crop of all pecans in Florida was 5,000,000 pounds, up 47 percent from 1983 and 11 percent from 1982. Of the total pounds utilized, 2,800,000 pounds were native or seedling varieties. The average price for all pecans was 54.0 cents per pound. The improved varieties brought 65.5 cents per pound , 4.8 cents less than last year. The native or seedling types averaged 45.0 cents per pound, 1.5 cents less than 1982. The value of the pecan crop was placed at $2,701,000, 39 percent more than the previous year and 8 percent more than 1982.

Potato production in Florida in 1984, including both winter and spring, totaled 7.9 million cwt, 31 percent more than last year. A total of 34,000 acres were planted in 1984, 9 percent more than 1983. Of the total acreage planted, 33,600 acres were harvested, 7 percent more than 1983. The value of the crop was placed at $70.5 million, up 26 percent from the previous year. The increase in value was due to the large increase in production as the season average price dropped 35 cents. The average price received for all potatoes was $8.90 per cwt.

The average yield for all seasons combined was 236 cwt per acre, a new record for Florida. In the Hastings area which includes Flagler, Putnam, and St. Johns counties, the average yield was 260 cwt per acre, up 50 cwt from last year. This is a record yield for this area. Spring potatoes grown in other areas of the State had an average yield of 200 cwt per acre, 45 cwt more than 1983 but 10 cwt less than 1982. The average yield for the 1984 winter crop was 160 cwt per acre, up 20 cwt from 1983.

The "red-skinned" varieties are the dominant varieties grown for winter harvest in south Florida. Most of the winter crop is sold for table stock but a few are sold to the potato chip industry. In the Hastings area, the "white-skinned" varieties dominate. Most of the Hastings production goes to the potato chip industry, although fresh market or table stock sales are increasing in importance.

The winter potato harvest was underway in January and progressed through March and April. Winter harvest was very active in April. Harvest of the spring crop in the Hastings area got underway in mid-April with peak harvest in May. Digging continued into June and then declined sharply about midmonth. Abandonment of acreage was about normal throughout the season. The winter crop suffered some light damage but the plants recovered to produce very good yields.

Field crops: Acreage, yield, production and value, Florida, crop years 1974 through 1984 1/

"WHY CROP AND LIVESTOCK REPORTS"

A man's judgment is no better than his facts and crop and livestock reports are the basic facts of agriculture.

They aid farmers in planning their production and marketing and contribute to more orderly markets.

They are the basis for analysis of agriculture and other business conditions.

They enable the marketing pipeline to make better distribution of facilities for moving farm products.

They give producers the same information for projecting future price trends that buyers and dealers possess.

They are a check on fluctuation in price, by reducing uncertainty of supply.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools, researchers, and others in planning constructive programs.

They give more information on surplus and deficit areas of production, making possible a more economical distribution of products.

They provide natural disaster and emergency preparedness personnel with reliable statistics on major areas of agricultural production, the kinds of products in storage, and storage locations. This information is very important in times of disasters or other emergencies affecting loss of life or property.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce uncertainty which limits speculation in farm products. Speculation adds to the cost of marketing.

They indicate potential buying power, enabling manufacturers to meet the probable demand.

They provide an accurate, reliable, unbiased picture of Florida's agriculture and furnish a sound basis for judgment and action by farmers, other individuals, the business community, transportation agencies, crop and livestock interests, and governmental agencies.
